CANDIDATE PHYSICAL TASK

FACILITY ID

TASK CLAIM ID

ECONOMIC CLAIM ID

CONTACT-FACILITY EVIDENCE ID

1 Motion and repeatability

Describe one object, start point, end point, and normal cycle. Keep variants separate.

- [ ] Motion repeats within a run
- [ ] Object presentation is observable
- [ ] Cycle timing can be measured

2 Changeover and variation

List what changes between runs and whether the cell can adapt without a mechanical rebuild.

- [ ] Variant set is limited
- [ ] Changeover boundary is known
- [ ] No invented product or station detail

3 Intervention and exceptions

Name misfeeds, reorientation, quality checks, or recovery work and how often each occurs.

- [ ] Normal cases dominate
- [ ] Intervention frequency is bounded
- [ ] People retain true exceptions

4 Safety and integration

Record guarding, lifting, sanitation, damage risk, controls, space, and upstream/downstream limits.

- [ ] Safety constraint is explicit
- [ ] Integration owner is identified
- [ ] A stop condition is stated

5 Rate and operating consequence

Use sourced or operator-confirmed rate, staffing, stoppage, cycle-time, safety, or changeover impact.

- [ ] Consequence has a claim ID
- [ ] Unknown values stay unknown
- [ ] Manual work alone is not economics

6 Payback and first-pass result

Compare the smallest useful task coverage with integration cost and remaining operator work.

- [ ] Rule out
- [ ] Investigate after one missing fact
- [ ] Candidate for bounded evaluation

FIRST-PASS OUTPUT

Decision: [ ] rule out [ ] one fact missing [ ] bounded evaluation candidate
